

TREATING MOGOGO PLEXIGLASS

Maintenance for acrylic glass surfaces

Clean with soft cloth the dust first, and then moisten the soft cloth to wipe the acrylic sheet.

Dry with soft cloth or sponge to prevent water spots.

You can also clean and polish with cleaners made specifically for acrylic, like Novus #1 or Brilliance.

To avoid scratching, do not use scouring pad or coarse cloth.

Sterilizing:

Only neutral detergent or dishwashing liquid can be used. Bleach can be used for sterilizing.

Bleach need to be diluted in normal temperature water at 1:50 ~ 1:100.

Use the diluted bleach to wipe the acrylic sheet, make the bleach stay 10 minutes, and then wipe the acrylic sheet with normal water.

The bleaching water is volatile and irritant before and after dilution.

Be sure to wear a mask and gloves to prevent irritation of the skin and respiratory mucosa while diluting and using bleach.

Keep the environment ventilated to prevent the uncomfortable feeling of dizziness and vomiting caused by inhaling too much volatile gas. Meanwhile, in order to avoid producing harmful substances, do not mix with acid, ammonia, and amine components.

Attention:

Never use abrasive or highly alkaline cleansers.

Never scrape with razor blades or other sharp instruments.

Never use benzene, acetone, or carbon tetrachloride.

Never use cleaners such as Windex or 409.

Ensure the prevention of moisture, liquid or dirt does not get into mechanism.
